New in September 2026

Updates

- We have released a Whole System Design tool for automated kit combinations and design recommendations.
- Released Online Proposals which allow you to send your customers an interactive web link instead of (or alongside) a traditional PDF quote.
- Updated the Roof Outline design mode to a modern interface with automated roof detection.
- Added Smug smart battery optimisation which uses weather forecasting and machine learning to optimise battery charging and discharging.
- Added a search bar to the 'Extras' page in the Electrical task to improve component filtering.
  - A new search bar at the top of the Extras task now filters the list as you type, filtering through the catalogue of extras to help you quickly find the item you need.
    - Search by product name or description.
    - Results update as you type, and you'll see a clear message if nothing matches.
    - Extras that Easy PV adds automatically still appear as before.

- Added a field to Connect Direct applications for additional attachments.
  - Connect Direct applications now have an Additional attachments section, so supporting documents can go to the DNO with the application. Upload files from the

project overview (up to 10MB each), then add them to the form.

Fixes

- Fixed a rounding calculation flaw in non-MCS mode that triggered `NaN` formatting issues, and corrected a PVGIS data hang that returned empty `-%` flags and froze the Performance screen.
- Fixed a visual bug where GSE Ground Evolution panels were appearing partially hidden in the 3D model.
- Resolved a snapping bug in 3D and Magic mode where roofs couldn't be detected.
- Fixed an edge case where an obstruction completely covering a roof caused the program to crash.
